I will review the winding obstacle-strewn road of discoveries and adventures that fast radio burst (FRB) science has taken since the first discovery in 2007. Many mistakes, as well as key insights and discoveries have been made on this journey. At present, many astrophysical and cosmological applications of FRBs have been identified, significant progress is being made into identifying what their progenitors are and are not, and discovery rates continue to accelerate. But where next for FRB science?
